

Species *Methanomethylophilus alvi*^T

Etymology

[al'vi] L. gen. n. *alvi*, of the bowel, referring to the isolation source (human gut).

Nomenclatural type

[NCBI Assembly: CP017686](#)^{Ts}

Reference Strain

Mx-05 = JCM31474T = CIP112449

Description

The strain Mx-05 was isolated from the human gut. The cells of Mx-05T are non-motile cocci 0.4–0.7 µm in diameter. They grow anaerobically and reduced methanol, mono-, di-, and trimethylamine into methane, using H₂ as an electron donor. Mx-05 grows at temperature range between 30 °C and 40 °C (optimum 37 °C), over a pH range of 6.9–8.3 (optimum pH 7.5). The genome is 1.67 Mbp with a G+C content of 55.5 mol%.

Classification

Archaea » “Euryarchaeota” » *Thermoplasmata* » *Methanomassiliicoccales* » *Methanomethylophilaceae* » *Methanomethylophilus* » *Methanomethylophilus alvi*^T
